

JavaScript Array Methods — Developer Reference (Print-Optimized, Light Mode)

1. Transforming Arrays

map(fn) — new array of transformed items
flatMap(fn) — map + flatten one level
filter(fn) — keep items where fn returns true
reduce(fn, initial) — combine into a single value
reduceRight(fn, initial) — reduce from right to left

2. Searching Arrays

find(fn) — first matching item
findIndex(fn) — index of first match **findLast(fn)** — last matching item
findLastIndex(fn) — index of last match
includes(value) — true/false
indexOf(value) — first index
lastIndexOf(value) — last index
some(fn) — true if any match
every(fn) — true if all match

3. Looping (No New Array Returned)

forEach(fn) — run fn for each item

4. Mutating Methods (Modify Original Array)

push(value) — add to end
pop() — remove from end
shift() — remove from start
unshift(value) — add to start
splice(start, count, ...items) — add/remove items
sort(fn) — sort in place
reverse() — reverse in place
fill(value, start, end) — fill with value
copyWithin(target, start, end) — copy part of array inside itself

5. Non-Mutating Methods (Return New Array)

slice(start, end) — extract portion
concat(arr) — merge arrays
toReversed() — reversed copy
toSorted(fn) — sorted copy

toSpliced() — modified copy
with(index, value) — replace one element immutably

6. Converting Arrays

join(sep) — array → string
toString() — array → string
flat(depth) — flatten nested arrays
Array.from(iterable) — iterable → array
Array.isArray(value) — check if array

7. Iteration Helpers

keys() — iterator of indexes
values() — iterator of values
entries() — iterator of [index, value] pairs

8. Static Array Methods

Array.of(...items) — create array
Array.from(iterable) — convert iterable
Array.isArray(value) — check type

Developer Mental Model

map → convert each item
filter → keep some items
reduce → combine items
find → get one item
some/every → boolean checks
slice → copy
splice → cut
push/pop/shift/unshift → add/remove
